

Red Ball Drills® have been utilized in some of the nation's top health and hospital environments, including leading healthcare and university teaching facilities. Challenges and risks are large and diverse in this industry, requiring multi-faceted scenarios and drills specific to each site.

Our groundbreaking approach is strengthening the security and preparedness for top hospital and healthcare clinics and facilities nationwide.

**“Working with Red Ball Drills helped us to review processes which then resulted in immediate improvements in facility safety.”**  
- Major US Hospital Security Leader

**Red Ball Drills® are instrumental in allowing safety and security operations to start changing the conversation from “response” to “process” – with dramatic effect:**

- Provides a safe, collaborative way to assess policies, procedures and vulnerabilities without disrupting operations
- Scenarios have included actual incidents - ranging from violent outbursts in the ER, to chemical release in the lobby or live critical care areas
- Process can improve staff protection from active assailants, help identify sexual or physical harassment issues, and assist in evaluation of the associated 911 dispatch process.

**Our Safety, Communication, Control model differs from “Run, Hide, Fight” exercises in very fundamental ways.**

Other programs claim to be ‘customized’ for each client, but instead they focus on their own methodology. Red Ball Drills® are a truly different exercise – a location and site-specific preparation drill – fully scenario-driven by you!

In the actual running of any Red Ball Drills® there are never any simulated firearms, weapons, fakes, or trauma-inducing events. The revolutionary approach we bring is all about intelligent layers of learning and serious discussion among the participants and the stakeholders. **Call or visit us online to find out more.**
